

**Project Design Phase
Proposed Solution Template**

Date	15 February 2025
Team ID	6ab221fbe880316a482c6241
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	In ServiceNow, role-based access alone cannot stop users from viewing records that belong to a specific branch. Records meant only for the EEE branch can be seen by users from other branches, which risks data privacy and misuse.
2.	Idea / Solution description	Implement a script-controlled ACL on the records table for the read operation. The ACL script checks whether the logged-in user belongs to the EEE branch. If yes (or the user is an admin), answer = true and the record is shown; otherwise answer = false and the record is hidden.
3.	Novelty / Uniqueness	Access is decided at runtime by a script instead of only static roles, so the rule can use any user or record condition. It needs no extra plugin, is configured in the platform itself, and the branch condition can be changed by editing the script.
4.	Social Impact / Customer Satisfaction	Protects branch-specific data from unauthorized viewing, so users see only what is relevant to them. This builds trust in the system, keeps data confidential, and gives a cleaner and safer experience for students, faculty and admins.
5.	Business Model (Revenue Model)	Delivered as a reusable ServiceNow configuration (Update Set) for colleges and organizations. Revenue can come from one-time implementation fees, customization per department or branch, and support or maintenance contracts.
6.	Scalability of the Solution	The same ACL pattern can be extended to other branches (ECE, EEE,CSE), other tables and other operations (read, write, create, delete) by changing the condition in the script. It can also be moved between instances through an Update Set.
