Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	5 Marks

Coding & Solution

This section evaluates the quality and completeness of your implemented code and the overall solution. Your submission should demonstrate working functionality, clean code practices, and alignment with your defined requirements.

Instructions:

1. Ensure your code is well-structured, commented, and follows best practices for your chosen technology stack
2. The solution should address the core problem statement and implement the key functional requirements.
3. Include all source files, configuration files, and setup instructions needed to run the application.
4. Attach or link to your code repository (e.g., GitHub) in the table below.

Solution Summary

Field	Details
Repository Link / URL	[Paste your GitHub / GitLab / hosted link here]
Programming Language(s)	JavaScript (ServiceNow server-side scripting)
Framework(s) Used	ServiceNow Platform (Access Control Lists, Script Include, Roles)
Key Features Implemented	1. Script-controlled ACL that restricts record access based on a field value (for example, a record with State = Closed or Confidential = true is blocked for users without the required role). 2. Read and Write ACLs applied at the table level and, where needed, at the field level. 3. Role check combined with the field-value condition, and access is denied by default (answer = false). 4. Reusable Script Include for the role and field-value check, so the same logic works across multiple tables. 5. Null and empty field values handled safely to avoid errors. 6. Tested by impersonating users with different roles and with different field values.
Pending / Incomplete Features	1. ACL for Delete and Create operations can be added. 2. Logging or audit of denied access attempts. 3. Admin-configurable field values through a system property instead of hard-coded values. 4. Automated test cases (ATF) for the ACL rules.
Setup / Run Instructions	1. Log in to the ServiceNow instance (Personal Developer Instance) as an admin.

Field	Details
	2. Import the update set: System Update Sets > Retrieved Update Sets > Import XML, then Preview and Commit. 3. Open System Security > Access Control (ACL) and verify the new ACL rule for the target table and field. 4. Confirm that the Script Include is active (System Definition > Script Includes). 5. Create test users and assign roles as needed. 6. Impersonate each user and open records with different field values to verify that access is allowed or denied correctly.
