

Project Executable Files

Date	28 September 2026
Team ID	6ab221fbe880316a482c6241
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	3 Marks

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes – ServiceNow Update Set XML (script_controlled_acl_update_set.xml) with ACL, roles, and test data
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	NA
4	Database schema / seed files (if applicable)	Yes – Incident table extract + seed_incidents.csv
5	Environment configuration file (.env.example or similar)	NA
6	Deployed application URL (if hosted)	Yes – ServiceNow PDI instance
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes – Test cases and screenshots
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

```
/project-root
/update-sets
  script_controlled_acl_update_set.xml - Exported Update Set (ACL, roles, test users)
/scripts
  acl_incident_read_script.js          - ACL script (Incident read)
/data
  seed_incidents.csv                  - Sample records (Priority 1 to 4)
  users_roles.csv                     - Demo users and role assignment
/tests
  test_cases.md                       - Test cases and expected results
  /screenshots                        - Evidence for each test case
/docs
  README.md                           - Setup and run instructions
  demo_walkthrough.mp4                - Demo video
```

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	https://devXXXXXX.service-now.com (ServiceNow Personal Developer Instance)
Login Credentials (Demo)	Admin: admin / <password shared with evaluator> Restricted user: abel.tuter / <password> (no incident_manager role) Manager user: beth.anglin / <password> (has incident_manager role)
Platform / Hosting Provider	ServiceNow (Personal Developer Instance – developer.servicenow.com)
Repository Link	https://github.com/<your-username>/script-controlled-acl
Demo Video Link	https://drive.google.com/<your-demo-video-link>

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

Pre-requisites:

- ServiceNow Personal Developer Instance (Washington DC release or later)
- Admin access to the instance; modern web browser (Chrome / Edge)
- Update Set XML file from the /update-sets folder

Step 1: Log in to the ServiceNow instance as admin.

Step 2: Go to System Update Sets > Retrieved Update Sets > Import Update Set from XML, and upload script_controlled_acl_update_set.xml.

Step 3: Open the imported update set, click Preview Update Set, resolve any problems, then click Commit Update Set.

Step 4: Import seed data: System Import Sets > Load Data, upload seed_incidents.csv into the Incident table (Priority values 1 to 4).

Step 5: Create demo users and assign roles: give beth.anglin the incident_manager role; abel.tuter gets only the itil role.

Step 6: Confirm the ACL is active: System Security > Access Control (ACL), search table incident, operation read, and open the script-controlled ACL.

Step 7: Impersonate abel.tuter (Impersonate User) and open the Incident list. Priority 1 records must NOT be visible.

Step 8: Impersonate beth.anglin. All incidents, including Priority 1, must be visible.

ACL script used:

```
answer = false;
if (gs.hasRole('admin') || gs.hasRole('incident_manager'))
    answer = true;
else if (current.priority != 1)
    answer = true;
```

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	ACL is evaluated per record, so list load time may increase on very large tables.	Use an indexed field in the condition; keep the script lightweight.
2	Priority 1 records are hidden only for users without the incident_manager role; admin always bypasses.	By design. Add or remove roles as per requirement.

3	Data imported using Import Set/Transform Map can bypass the ACL.	Restrict import access to admin only.
